In the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

1-19. (Cancelled)

20. (Currently Amended) A method of providing a constant or substantially constant force for correcting spinal deformities in a patient, comprising:

applying a correction force having a predetermined amount to the deformed portion of the patient's spine, the correction force being generated by a superelastic material at the patient's body temperature and in an austenite phase of the superelastic material, the superelastic material having a transition temperature within the range of the patient's body temperature; and

maintaining the correction force at the predetermined amount until the spinal deformities are fully or substantially fully corrected;

wherein the correction force is constant or substantially constant and controllable during spinal deformity correction.

- 21. (Original) The method of claim 20, wherein the predetermined amount of the correction force can be adjusted.
- 22. (Original) The method of claim 20, wherein the correction force is activated during the spine correction surgery.

23-27. (Cancelled)

- 28. (Original) The method of claim 20, wherein the correction force is applied to the deformed spine portion from the anterior aspect of the spine.
- 29. (Original) The method of claim 20, wherein the correction force is applied to the deformed spine portion from the posterior aspect of the spine.

30-31. (Cancelled)

- 32. (Previously Presented) The method of claim 20, wherein the superelastic material forms a correction device to assume the normal kyphosis and lordosis of the spine.
- 33. (Previously Presented) The method of claim 32 further comprising deforming the correction device to conform to the portion of the spine to be corrected.
- 34. (Previously Presented) The method of claim 32 further comprising limiting the correction device from movement.
- 35. (Previously Presented) The method of claim 32 further comprising limiting the correction device from a rotation movement.
- 36. (Currently Amended) A method of providing a constant or substantially constant force for correcting spinal deformities of a patient, the method comprising:

providing a supporting member comprising a superelastic material for generating a correction force having a predetermined amount, the superelastic material having a transition temperature within the range of body temperature of the patient; and

maintaining the correction force at the predetermined amount until the spinal deformities are fully or substantially fully corrected;

wherein the supporting member generates the correction force at <u>the patient's</u> body temperature and in an austenite phase of the superelastic material.

- 37. (Previously Presented) The method of claim 36 further comprising deforming at least a portion of the supporting member to conform to the spinal deformities.
- 38. (Previously Presented) The method of claim 36, wherein the predetermined amount of the correction force can be adjusted.

- 39. (Previously Presented) The method of claim 36, wherein the correction force is activated during the spine correction surgery.
- 40. (Previously Presented) The method of claim 36 further comprising pre-contouring the supporting member to assume the normal kyphosis and lordosis of the spine.
- 41. (Previously Presented) The method of claim 36 further comprising limiting the supporting member from movement.
- 42. (Previously Presented) The method of claim 36 further comprising limiting the supporting member from a rotation movement.
- 43. (Previously Presented) The method of claim 36 further comprising providing an anchor member for mounting the supporting member to the deformed spine portion.
- 44. (Previously Presented) The method of claim 43, wherein the anchor member comprises a superelastic material.
- 45. (Previously Presented) The method of claim 43, wherein the anchor member comprises a pseudoelastic material.
- 46. (Currently Amended) A method of correcting a spinal deformity of a recipient, the method comprising:

applying a supporting member comprising a superelastic material to a deformed spinal portion of a recipient;

generating a correction force at the recipient's body temperature and in an austenite phase of the superelastic material, the superelastic material having a transition temperature within the range of the recipient's body temperature; and

maintaining the correction force until the spinal deformity is fully or substantially fully corrected.

- 47. (New) The method of claim 20, wherein the correction force is not remotely activated.
- 48. (New) The method of claim 36, wherein the correction force is not remotely activated.
- 49. (New) The method of claim 46, wherein the correction force is not remotely activated.
